

The threat of cyber terrorism

To protect your company's main systems from

cyber attacks

As the number of *DDoS attacks and targeted e-mails on the Japanese government is on the rise, its classified information and computer systems are exposed to more and more threats of cyber attacks.

*A DDoS attack is an attempt to make a computer service unavailable by sending a huge amount of data simultaneously.

Information security measures for enterprises and organizations

- 1 Update your OS, web browser, and other software.**
- 2 Update your antivirus software and run a virus check on all data in your computer regularly.**
- 3 Introduce password control, a firewall and a hacking-detection system.**
- 4 Strengthen customer information control.**
- 5 Strengthen controls on user authority and passwords to prevent information leaks.**
